Introduction

- With Social Media sites becoming saturated, you would not want to miss a tweet from a friend because you were following everyone you met on campus. Came up with an idea to allow a user to specify what relationship they have with other users so that they would not miss their friend's tweets

Problem Statement & Core Task

Problem is that everyone you follow, you get recommended tweets that they like. Sometimes you follow a person because you know them not for their tweets. Core task will have different weights/Cost for a 'follower' and a 'friend', where a user will be recommended a 'friend's (liked) tweets.

Things Needed

OBJECTS

- Profile of a user which will include username, and their relevant tweets.

## CONNECTION

- Friend

- Follower

Summary

The connections between the vertices will have different costs/weight as to allow the filtering of contents easy for a user.

Thank You
